

Three systems for FutureUni's three hardest problems

Client acquisition, marketing & social output, and the workflow automation pipeline. Here is what the dev team is building for each, and what it can already do.

HARDEST · 01

Client acquisition

The Growth Engine.

02

Marketing & social

The Content Engine.

03

Workflow automation

The shared layer under both.

01 — The Growth Engine (client acquisition)

Five stages, running on a schedule. Claude is used at exactly two points — writing outreach and reviewing borderline calls.

Solid = automated on a schedule. Dashed = where Claude is actually called.

- 1 Source**
Find businesses showing a visible need — outdated sites, weak ad pages, inconsistent content, hiring signals.

Automated

- 2 Enrich**
Turn a company name into a reachable lead: size, sector, the actual decision-maker.

Automated

- 3 Score**
Rank 0–100 against our client profile, reason attached. Borderline cases get a Claude second opinion.

Rules + Claude

- 4 Reach out**

Claude writes a specific opener per lead. A human reply stops automation instantly.

Claude writes

5 Hand over

Funnel, scores and history land on a dashboard — sales sees it and acts.

Dashboard

02 — The Content Engine (marketing & social)

The same discipline applied to output instead of outreach: plan once, produce everywhere, post on schedule, learn from what worked.

1 Plan

Monthly goals become a content calendar mapped to FutureUni's brand pillars.

Claude plans

2 Generate

One long-form piece becomes posts, captions, hooks and scripts across every channel, in our voice — not generic AI copy.

Claude writes

3 Design

A brief-writing Skill turns each content idea into a structured visual brief so designers start from clarity, not guesswork.

Claude briefs

4 Post

Approved content is scheduled and published across channels automatically, no one manually uploading at 9pm.

Automated

5 Report

Engagement is pulled weekly into a plain summary — what worked feeds directly back into the next month's plan.

03 — The layer underneath both: automated workflow systems

The Growth Engine and Content Engine both run on the same foundation — Claude Skills (written playbooks for how FutureUni works) plus scheduled automation instead of someone remembering to do a task. The same foundation extends to HR screening, admin reporting, and proposal drafting once these two are running. One system, many uses — not five separate tools.

Also on the table: our websites, built faster and sharper

Claude Code lets the dev team ship high-class, animated, 3D-driven websites — for FutureUni itself and for client delivery — in a fraction of the usual build time.

Our own site, rebuilt

A site that matches the standard we sell to clients — motion, depth, and a build quality that itself proves what FutureUni can do.

Faster client delivery

The same capability shortens turnaround on client websites, which is currently one of our slowest delivery lines.

What this makes possible

Leads while we sleep

Ranked leads waiting every morning — no one has to go looking for them.

A month of content in a day

Planned, written and briefed in one sitting instead of stretched across a month.

A live view of everything

One dashboard for the funnel, one calendar for content — no more scattered spreadsheets.

Sites that sell themselves

Our own portfolio becomes the proof, not just a claim.

What we'd need

Our target client profile confirmed, one more developer, and a few hours a week from sales to review outreach copy.

What we already have

The architecture worked out for all three systems, ready to hand to Claude Code.

This is what we can build with what we already have. We're not asking for a budget to explore Claude Code — we're asking for the green light to point it at all three.
